

A Multimessenger Window into

The Dark Matters of the Universe

Milena Crnogorčević

How do we know* dark matter is there?

Which photo was taken on a windy day?

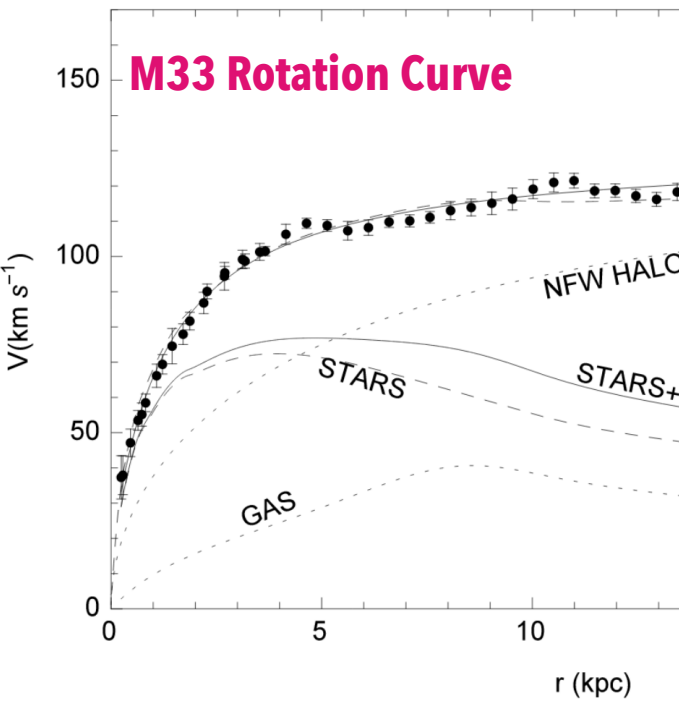

[Images taken from Adobe Stock]

Overwhelming evidence for the existence of dark matter on **all scales**

local universe

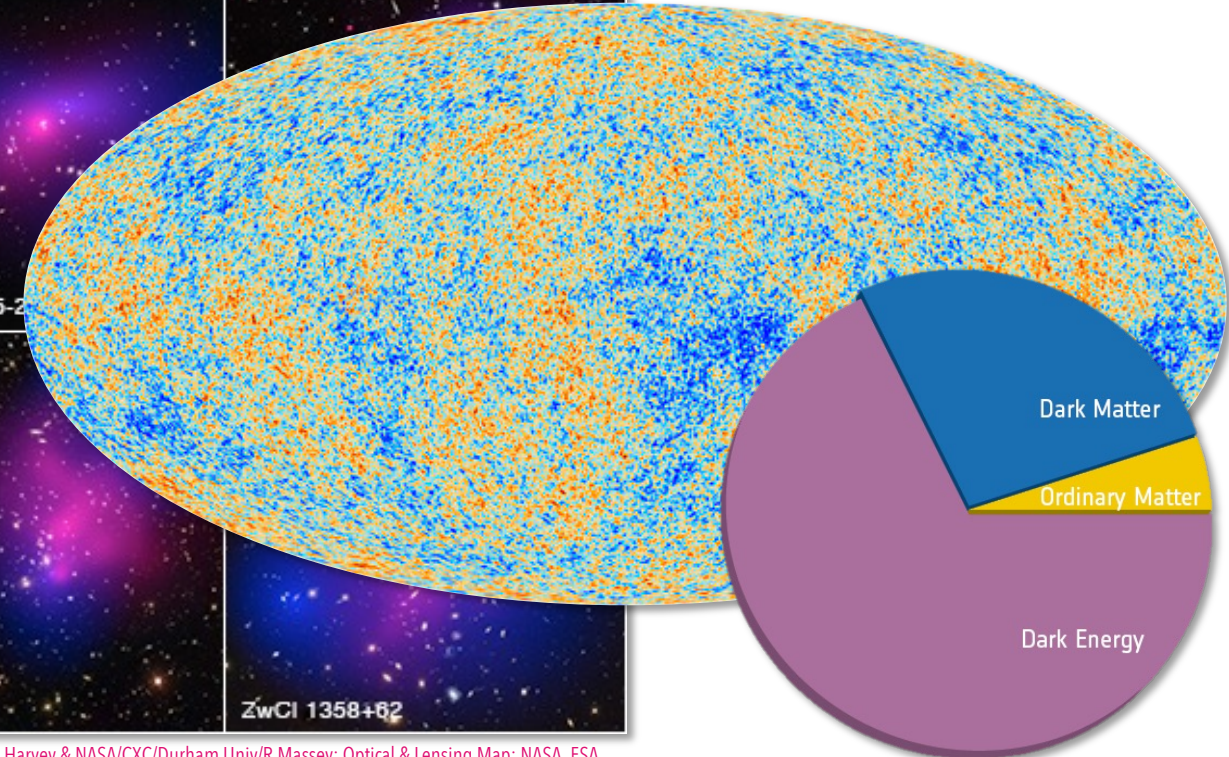

cosmological distances

Galaxy Clusters

CMB

X-ray: NASA/CXC/Ecole Polytechnique Federale de Lausanne, Switzerland/D.Harvey & NASA/CXC/Durham Univ/R.Massey; Optical & Lensing Map: NASA, ESA, D. Harvey (Ecole Polytechnique Federale de Lausanne, Switzerland) and R. Massey (Durham University, UK)

The background of the slide is split into two main visual components. On the left, there is a Cosmic Microwave Background (CMB) fluctuation map, showing a complex pattern of blue and orange/yellow spots representing temperature variations in the early universe. On the right, there is a visualization of the dark matter distribution, showing a dense, interconnected network of purple and blue filaments and nodes, representing the 'cosmic web' structure of the universe.

Dark Matter...

- makes up 85% of matter in the Universe.
- shapes galaxies and large-scale structure.
- is an essential ingredient of our current cosmological model.
- interacts weakly (if at all).

[Planck Collaboration]

[MillenniumTNG]

What is dark matter made of?

Standard Model of Elementary Particles

three generations of matter (fermions)			interactions / force carriers (bosons)		
	I	II	III

Dark Matter Landscape: A Theorist's View

Dark Matter Landscape: A Theorist's View

Dark matter spans over **80 orders** of magnitude in mass (+ interaction strength)

proton
 $m \sim 10^{-27}$ kg

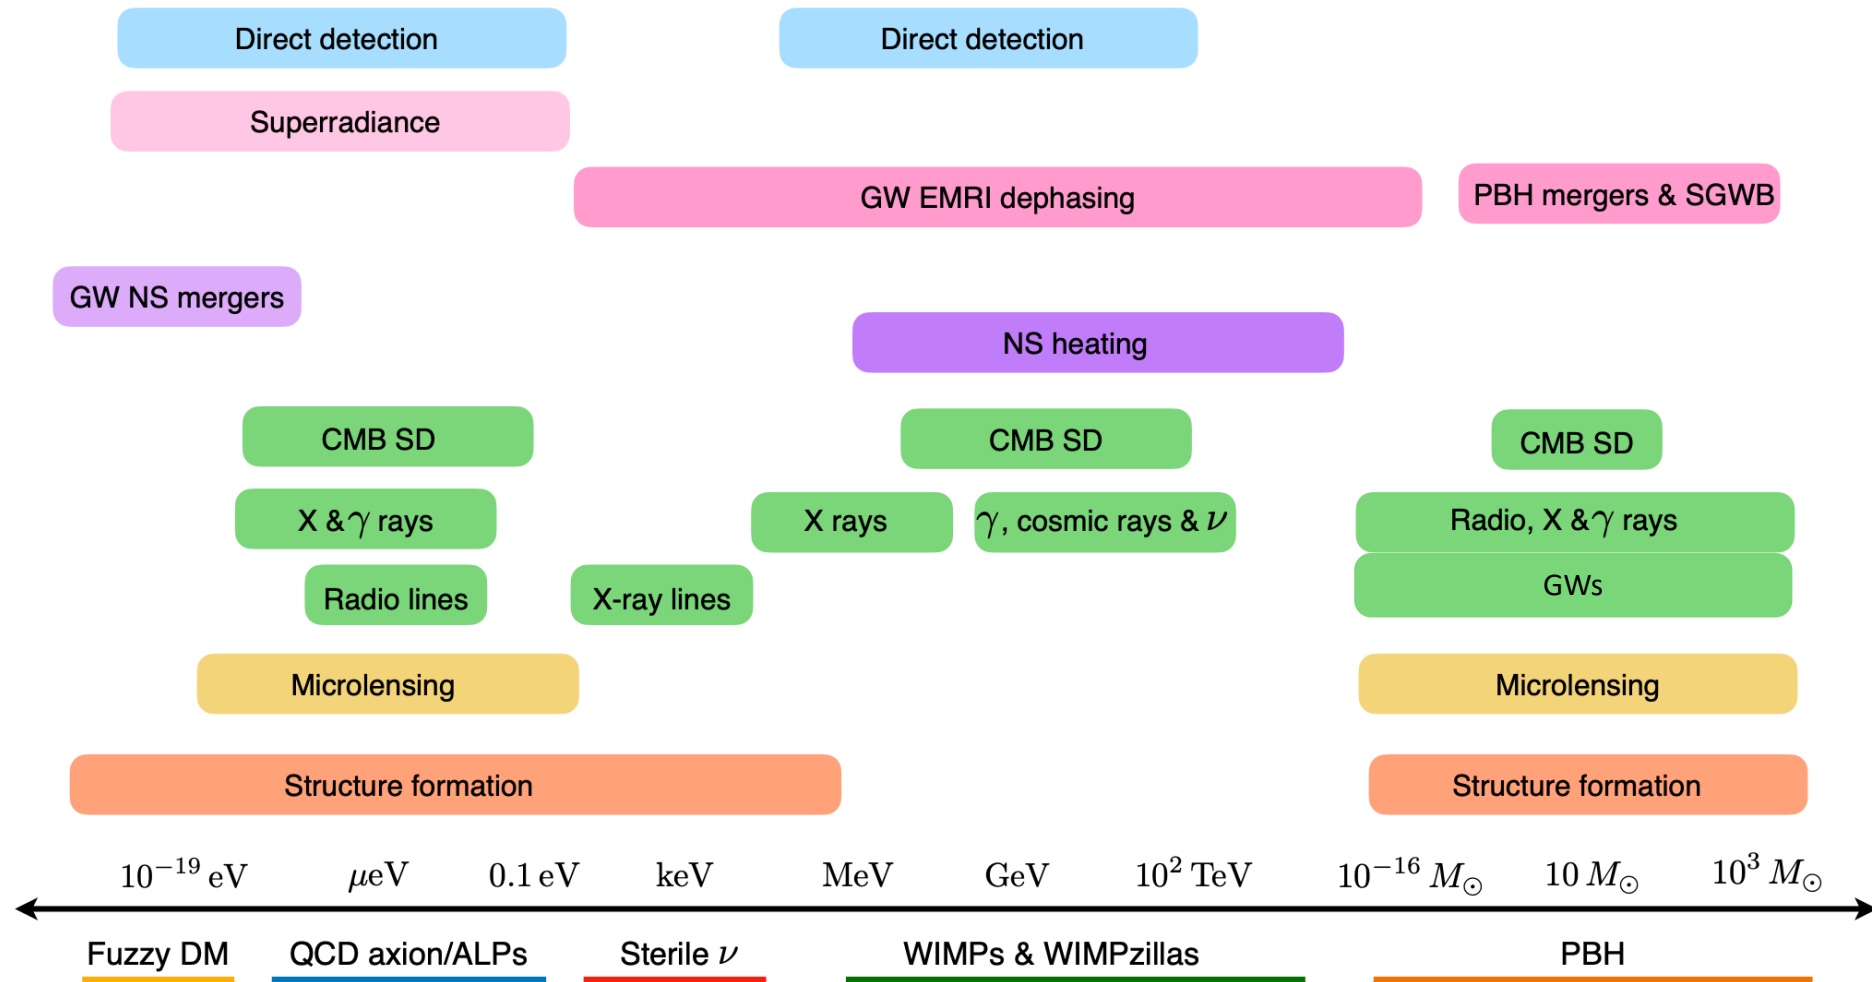

Dark Matter Landscape: A Theorist's View

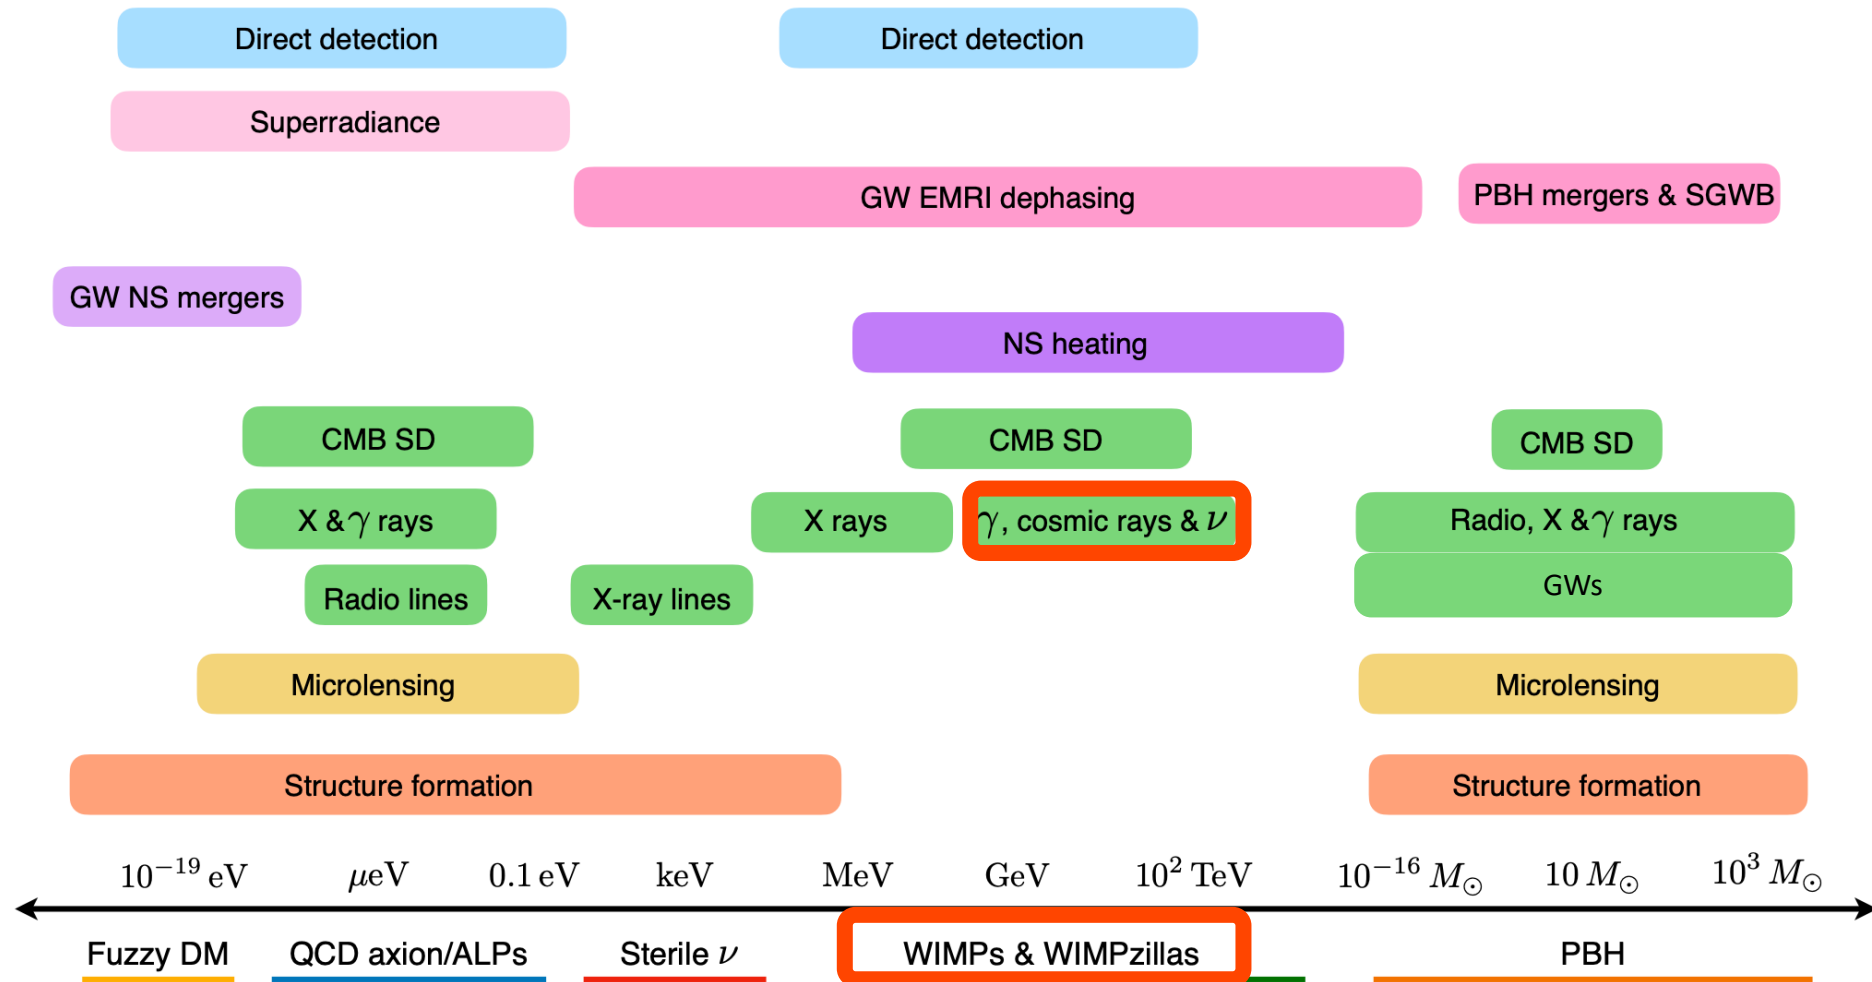

Our search strategies are inherently *biased*

1. **model dependency bias:** theory guides our search strategies
2. **observational bias:** disparity between the data we have and the data we need
3. **identifiable signature bias:** required for observation

Dark Matter Landscape: An Observer's View

Gamma rays from the Galactic Center

c: Silvia Marconi

-Did we reach the instrumental limits? What about theoretical models?

Diffuse models are not representative of the data

Confirming pulsars: future detections of radio emission by MeerKat and SKA

Confirming dark matter: check for signals elsewhere (or build a better instrument?)

Let's look elsewhere...

Dwarf spheroidal galaxies (dSphs)

→ most dark-matter dominated systems known in the Universe

→ 61 dwarf satellites identified so far in the Milky Way, more on the horizon

→ nearby (furthest 460 kpc), some within single-digit kpc

→ not much astrophysical background, inactive

Dwarf spheroidal galaxies (dSphs)

- Fermi 2017 (41dSph, 95% CL)
- H.E.S.S. 2020 (5dSph, 95% CL)
- IceCube 2013 (2dSph, 90% CL)
- MAGIC 2022 (4dSph, 95% CL)

How many dwarf galaxies do we *really* need?

How many dwarf galaxies do we *really* need?

Maybe just one, but a good one?

Ursa Major III

[Discovery: Smith+ 2023]

[J-factor: Errani+ 2023]

→ Unstable unless large DM content

→ Nearby (~ 10 kpc)

→ Strong constraints on DM annihilation

→ *Confirming the dark matter density requires deeper optical surveys*

Future of dwarfs: observer's view

good
dwarf

Future of dwarfs: observer's view

Future of dwarfs: observer's view

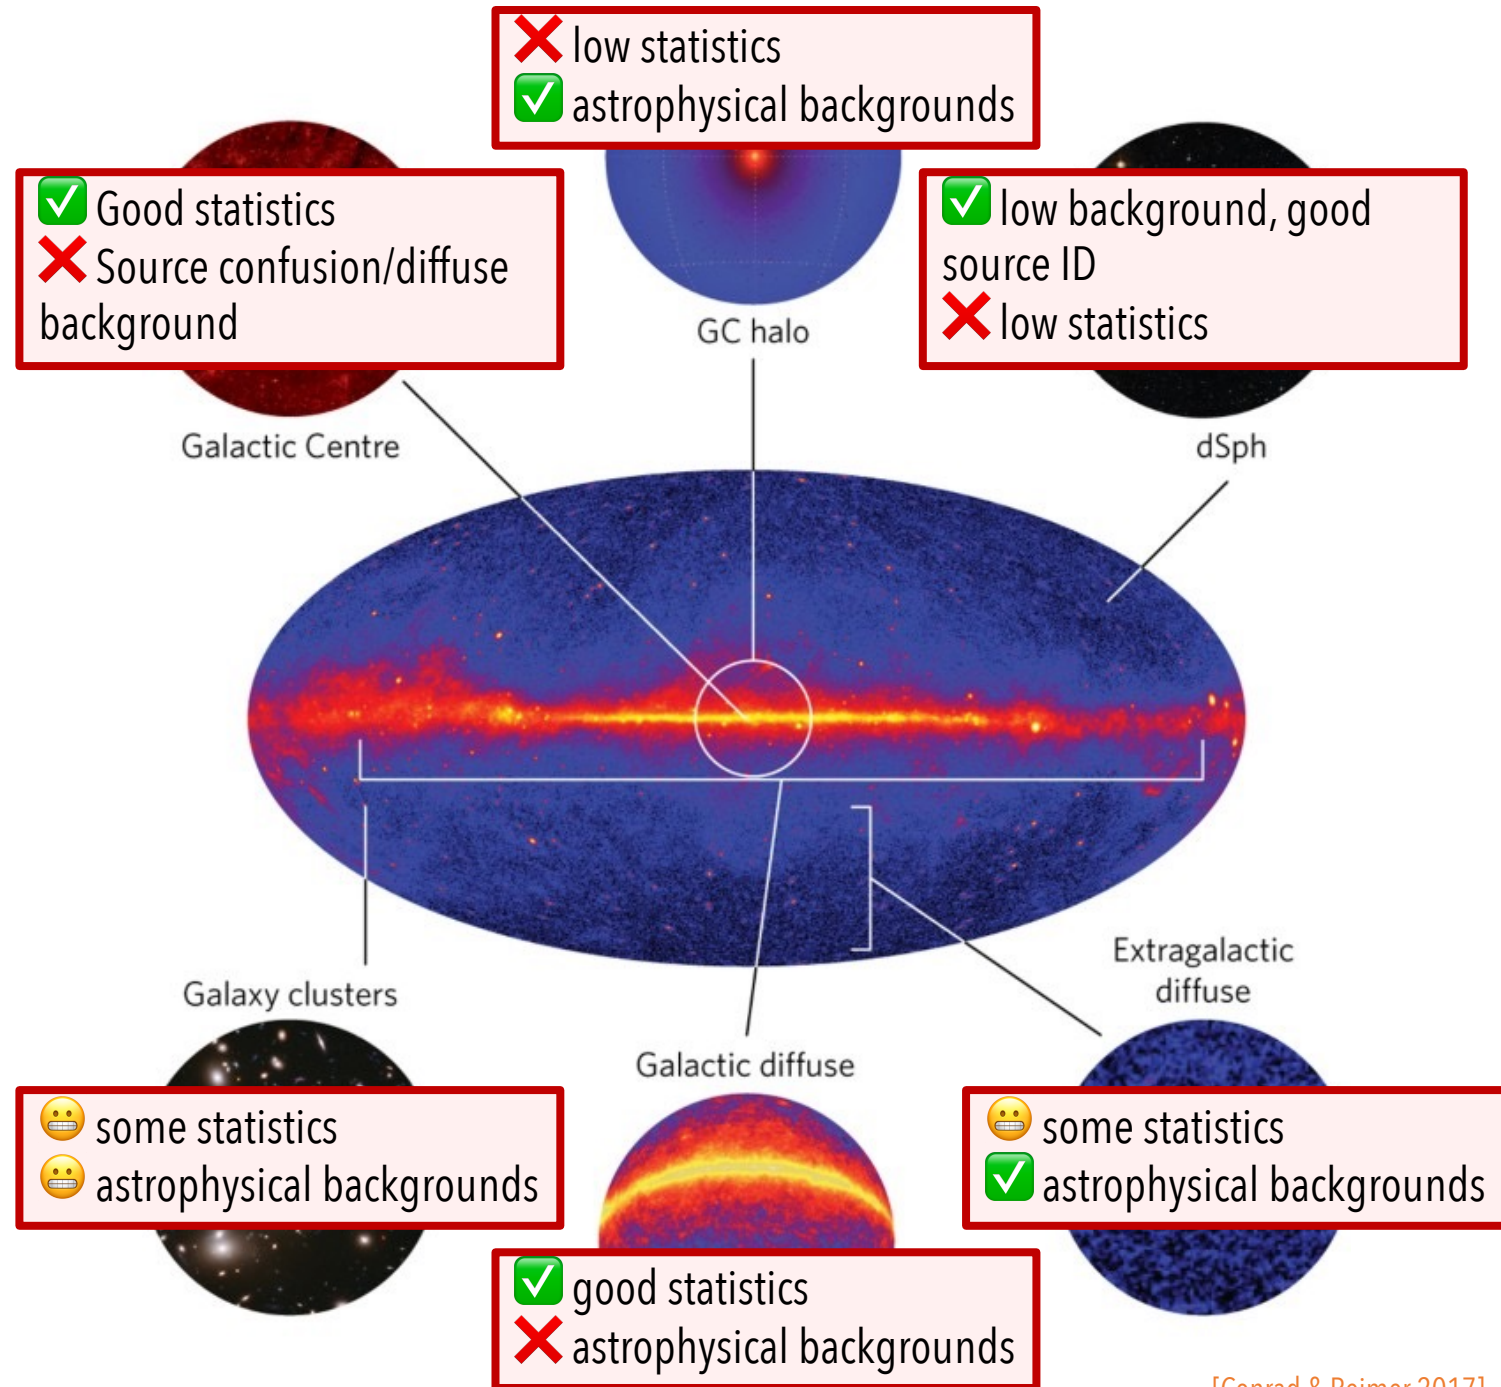

DM targets

Also: Solar System (Sun, Jupiter), brown dwarfs, exoplanets, etc.
Nguyen+ 25, 26, Leane+ 23, Blanco+ 24, 25, etc.

DM targets

Also: Solar System (Sun, Jupiter), brown dwarfs, exoplanets, etc.
 Nguyen+ 25, 26, Leane+ 23, Blanco+ 24, 25, etc.

TARGET

CURRENT STATUS

FUTURE

Galactic Center

Bright GeV excess; disputed origin

Diffuse modelling; sub-threshold source ID w/ radio

Dwarf spheroidals

Thermal $\langle\sigma v\rangle$ excluded below 100 GeV

LSST/Rubin: hundreds of new dSphs/a few good ones/JLA

Galaxy clusters

Strong limits (high-latitude halo, groups)

J-factor + CR systematics

DM subhaloes

Candidates in LAT unassociated sources

ML identification + Gaia follow-up

Galactic halo

Most constraining at $E > 1$ TeV (HESS)

CTAO improves HESS by up to $\times 10$

MeV / sub-GeV sky

Largely unexplored

- VLAST?

1968, Orbiting Solar Observatory, OSO-3 (~50 MeV)

2000, COMPTEL (onboard CGRO), 1–30 MeV

2000, EGRET (onboard CGRO), above 100 MeV

2020, LAT (onboard *Fermi*), above 500 MeV

Report of the Gamma Ray Astronomy Program Working Group
April, 1997

- Intermediate Missions: Fermi, NuSTAR and now COSI
- MIDEX and SMEX: Swift and NICER
- Technology: a robust technology development program (SiPMs, new scintillators, upgraded silicon detectors, etc)
- Balloons (+ CubeSats!): long duration balloons enabled COSI, LEAP, etc.
- Data Analysis & Theory: mainly supported through GI programs
- TeV Astronomy: VERITAS, HESS, HAWC, and MAGIC.
